Mathematics (2)

2.1 Equations

$$ax^2 + bx + c = 0 \Rightarrow x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

The extremum is given by $x = -b/2a$.

$$\begin{aligned} ax + by &= e & x &= \frac{ed - bf}{ad - bc} \\ cx + dy &= f & y &= \frac{af - ec}{ad - bc} \end{aligned}$$

In general, given an equation $Ax = b$, the solution to a variable x_i is given by

$$x_i = \frac{\det A'_i}{\det A}$$

where A'_i is A with the i 'th column replaced by b .

2.2 Trigonometry

$$\begin{aligned} \sin(v + w) &= \sin v \cos w + \cos v \sin w \\ \cos(v + w) &= \cos v \cos w - \sin v \sin w \end{aligned}$$

Makefile hash hash-cpp

$$\begin{aligned} \tan(v + w) &= \frac{\tan v + \tan w}{1 - \tan v \tan w} \\ \sin v + \sin w &= 2 \sin \frac{v + w}{2} \cos \frac{v - w}{2} \\ \cos v + \cos w &= 2 \cos \frac{v + w}{2} \cos \frac{v - w}{2} \end{aligned}$$

$$(V + W) \tan(v - w)/2 = (V - W) \tan(v + w)/2$$

where V, W are lengths of sides opposite angles v, w .

$$\begin{aligned} a \cos x + b \sin x &= r \cos(x - \phi) \\ a \sin x + b \cos x &= r \sin(x + \phi) \end{aligned}$$

where $r = \sqrt{a^2 + b^2}, \phi = \text{atan2}(b, a)$.

2.3 Geometry

2.3.1 Triangles

Side lengths: a, b, c
Semiperimeter: $p = \frac{a + b + c}{2}$
Area: $A = \sqrt{p(p - a)(p - b)(p - c)}$
Circumradius: $R = \frac{abc}{4A}$
Inradius: $r = \frac{A}{p}$

Length of median (divides triangle into two equal-area triangles):

$$m_a = \frac{1}{2} \sqrt{2b^2 + 2c^2 - a^2}$$

Length of bisector (divides angles in two):

$$s_a = \sqrt{bc \left[1 - \left(\frac{a}{b + c} \right)^2 \right]}$$

Law of sines: $\frac{\sin \alpha}{a} = \frac{\sin \beta}{b} = \frac{\sin \gamma}{c} = \frac{1}{2R}$

Law of cosines: $a^2 = b^2 + c^2 - 2bc \cos \alpha$

Law of tangents: $\frac{a + b}{a - b} = \frac{\tan \frac{\alpha + \beta}{2}}{\tan \frac{\alpha - \beta}{2}}$

Pick's: A polygon on an integer grid strictly containing i lattice points and having b lattice points on the boundary has area $i + \frac{b}{2} - 1$. (Nothing similar in higher dimensions)

2.3.2 Quadrilaterals

With side lengths a, b, c, d , diagonals e, f , diagonals angle θ , area A and magic flux $F = b^2 + d^2 - a^2 - c^2$:

$$4A = 2ef \cdot \sin \theta = F \tan \theta = \sqrt{4e^2 f^2 - F^2}$$

For cyclic quadrilaterals the sum of opposite angles is 180° , $ef = ac + bd$, and $A = \sqrt{(p - a)(p - b)(p - c)(p - d)}$.

2.3.3 Spherical coordinates

$$\begin{aligned} x &= r \sin \theta \cos \phi & r &= \sqrt{x^2 + y^2 + z^2} \\ y &= r \sin \theta \sin \phi & \theta &= \arccos(z / \sqrt{x^2 + y^2 + z^2}) \\ z &= r \cos \theta & \phi &= \text{atan2}(y, x) \end{aligned}$$

2.4 Derivatives/Integrals

$$\frac{d}{dx} \arcsin x = \frac{1}{\sqrt{1 - x^2}} \quad \frac{d}{dx} \arccos x = -\frac{1}{\sqrt{1 - x^2}}$$

$$\frac{d}{dx} \tan x = 1 + \tan^2 x \quad \frac{d}{dx} \arctan x = \frac{1}{1 + x^2}$$

$$\int \tan ax = -\frac{\ln |\cos ax|}{a} \quad \int x \sin ax = \frac{\sin ax - ax \cos ax}{a^2}$$

$$\int e^{-x^2} = \frac{\sqrt{\pi}}{2} \text{erf}(x) \quad \int x e^{ax} dx = \frac{e^{ax}}{a^2} (ax - 1)$$

2.4.1 XOR sum

$$\bigoplus_{x=0}^{n-1} x = \{0, n - 1, 1, n\} [n \bmod 4]$$

$$\bigoplus_{x=l}^{r-1} x = \bigoplus_{a=0}^{r-1} a \oplus \bigoplus_{b=0}^{l-1} b$$

2.5 Series

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots, (-\infty < x < \infty)$$

$$\ln(1 + x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots, (-1 < x \leq 1)$$

$$\sqrt{1 + x} = 1 + \frac{x}{2} - \frac{x^2}{8} + \frac{2x^3}{32} - \frac{5x^4}{128} + \dots, (-1 \leq x \leq 1)$$

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots, (-\infty < x < \infty)$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \dots, (-\infty < x < \infty)$$

2.6 Probability theory

Let X be a discrete random variable with probability $p_X(x)$ of assuming the value x . It will then have an expected value (mean) $\mu = \mathbb{E}(X) = \sum_x x p_X(x)$ and variance $\sigma^2 = V(X) = \mathbb{E}(X^2) - (\mathbb{E}(X))^2 = \sum_x (x - \mathbb{E}(X))^2 p_X(x)$ where σ is the standard deviation. If X is instead continuous it will have a probability density function $f_X(x)$ and the sums above will instead be integrals with $p_X(x)$ replaced by $f_X(x)$.

Expectation is linear:

$$\mathbb{E}(aX + bY) = a\mathbb{E}(X) + b\mathbb{E}(Y)$$

For independent X and Y ,

$$V(aX + bY) = a^2V(X) + b^2V(Y).$$

2.6.1 Discrete distributions

Binomial distribution

The number of successes in n independent yes/no experiments, each which yields success with probability p is $\text{Bin}(n, p)$, $n = 1, 2, \dots$, $0 \leq p \leq 1$.

$$p(k) = \binom{n}{k} p^k (1 - p)^{n - k}$$

$$\mu = np, \sigma^2 = np(1 - p)$$

$\text{Bin}(n, p)$ is approximately $\text{Po}(np)$ for small p .

2.7 Markov chains

A *Markov chain* is a discrete random process with the property that the next state depends only on the current state. Let X_1, X_2, \dots be a sequence of random variables generated by the Markov process. Then there is a transition matrix $\mathbf{P} = (p_{ij})$, with $p_{ij} = \Pr(X_n = i | X_{n-1} = j)$, and $\mathbf{p}^{(n)} = \mathbf{P}^n \mathbf{p}^{(0)}$ is the probability distribution for X_n (i.e., $p_i^{(n)} = \Pr(X_n = i)$), where $\mathbf{p}^{(0)}$ is the initial distribution.

π is a stationary distribution if $\pi = \pi \mathbf{P}$. If the Markov chain is *irreducible* (it is possible to get to any state from any state), then $\pi_i = \frac{1}{\mathbb{E}(T_i)}$ where $\mathbb{E}(T_i)$ is the expected time between two visits in state i . π_j / π_i is the expected number of visits in state j between two visits in state i .

For a connected, undirected and non-bipartite graph, where the transition probability is uniform among all neighbors, π_i is proportional to node i 's degree.

A Markov chain is *ergodic* if the asymptotic distribution is independent of the initial distribution. A finite Markov chain is ergodic iff it is irreducible and *aperiodic* (i.e., the gcd of cycle lengths is 1). $\lim_{k \rightarrow \infty} \mathbf{P}^k = \mathbf{1}\pi$.

A Markov chain is an absorbing chain if

- 1. there is at least one absorbing state and
- 2. it is possible to go from any state to at least one absorbing state in a finite number of steps.

A Markov chain is an A-chain if the states can be partitioned into two sets \mathbf{A} and \mathbf{G} , such that all states in \mathbf{A} are absorbing ($p_{ii} = 1$), and all states in \mathbf{G} leads to an absorbing state in \mathbf{A} . The probability for absorption in state $i \in \mathbf{A}$, when the initial state is j , is $a_{ij} = p_{ij} + \sum_{k \in \mathbf{G}} a_{ik} p_{kj}$. The expected time until absorption, when the initial state is i , is $t_i = 1 + \sum_{k \in \mathbf{G}} p_{ki} t_k$.

Data Structures (3)

order-statistic-tree.h

Description: A set (not multiset!) with support for finding the n'th element, and finding the index of an element.

Time: $\mathcal{O}(\log N)$

rmq.h

Description: Range Minimum/Maximum Queries on an array. Returns $\min(V[a], V[a + 1], \dots V[b])$ in constant time. Returns a pair that holds the answer, first element is the value and the second is the index.

Usage: `rmq_t<pair<int, int>> rmq(values);`
// values is a vector of pairs {val(i), index(i)}
`rmq.query(inclusive, exclusive);`
`rmq_t<pair<int, int>, greater<pair<int, int>>> rmq(values)`
//max query
Time: $\mathcal{O}(|V| \log |V| + Q)$

```
template<typename T, typename Cmp=less<T>>
struct rmq_t : private Cmp {
    int N = 0;
    vector<vector<T>> table;
    const T& min(const T& a, const T& b) const { return Cmp::
        operator()(a, b) ? a : b; }
    rmq_t() {}
    rmq_t(const vector<T>& values) : N(int(values.size())), table

    }
}

```

tridiagonal.h

Description: $x = \text{tridiagonal}(d, p, q, b)$ solves the equation system

$$\begin{pmatrix} b_0 \\ b_1 \\ b_2 \\ b_3 \\ \vdots \\ b_{n-1} \end{pmatrix} = \begin{pmatrix} d_0 & p_0 & 0 & 0 & \cdots & 0 \\ q_0 & d_1 & p_1 & 0 & \cdots & 0 \\ 0 & q_1 & d_2 & p_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \ddots & \ddots & \vdots \\ 0 & 0 & \cdots & q_{n-3} & d_{n-2} & p_{n-2} \\ 0 & 0 & \cdots & 0 & q_{n-2} & d_{n-1} \end{pmatrix} \begin{pmatrix} x_0 \\ x_1 \\ x_2 \\ x_3 \\ \vdots \\ x_{n-1} \end{pmatrix}.$$

This is useful for solving problems on the type

$$a_i = b_i a_{i-1} + c_i a_{i+1} + d_i, 1 \leq i \leq n,$$

where a_0, a_{n+1}, b_i, c_i and d_i are known. a can then be obtained from

$$\{a_i\} = \text{tridiagonal}(\{1, -1, -1, \dots, -1, 1\}, \{0, c_1, c_2, \dots, c_n\}, \{b_1, b_2, \dots, b_n, 0\}, \{a_0, d_1, d_2, \dots, d_n, a_{n+1}\}).$$

Fails if the solution is not unique.

If $|d_i| > |p_i| + |q_{i-1}|$ for all i , or $|d_i| > |p_{i-1}| + |q_i|$, or the matrix is positive definite, the algorithm is numerically stable and neither tr nor the check for $\text{diag}[i] == 0$ is needed.

Time: $\mathcal{O}(N)$

```

4.1.1 LP formulation

Standard form: maximize $\mathbf{c}^T \mathbf{x}$ subject to $A\mathbf{x} \leq \mathbf{b}$ and $\mathbf{x} \geq 0$.

Dual LP: minimize $\mathbf{b}^T \mathbf{y}$ subject to $A^T \mathbf{y} \geq \mathbf{c}$ and $\mathbf{y} \geq 0$.

$\bar{\mathbf{x}}$ and $\bar{\mathbf{y}}$ are optimal if and only if for all $i \in [1, n]$, either $\bar{x}_i = 0$

or $\sum_{j=1}^m A_{ji} \bar{y}_j = c_i$ holds and for all $i \in [1, m]$ either $\bar{y}_i = 0$ or

$\sum_{j=1}^n A_{ij} \bar{x}_j = b_j$ holds.

1. In case of minimization, let $c'_i = -c_i$

2. $\sum_{1 \leq i \leq n} A_{ji} x_i \geq b_j \rightarrow \sum_{1 \leq i \leq n} -A_{ji} x_i \leq -b_j$

3. $\sum_{1 \leq i \leq n} A_{ji} x_i = b_j$

• $\sum_{1 \leq i \leq n} A_{ji} x_i \leq b_j$

• $\sum_{1 \leq i \leq n} A_{ji} x_i \geq b_j$

4.1.2 Generating functions

A list of generating functions for useful sequences:

4. If x_i has no lower bound, replace x_i with $x_i - x'_i$

| | |
|--|-------------------------|
| $(1, 1, 1, 1, 1, \dots)$ | $\frac{1}{1-z}$ |
| $(1, -1, 1, -1, 1, \dots)$ | $\frac{1}{1+z}$ |
| $(1, 0, 1, 0, 1, 0, \dots)$ | $\frac{1}{1-z^2}$ |
| $(1, 0, \dots, 0, 1, 0, 1, 0, \dots, 0, 1, 0, \dots)$ | $\frac{1}{1-z^2}$ |
| $(1, 2, 3, 4, 5, 6, \dots)$ | $\frac{1}{(1-z)^2}$ |
| $(1, \binom{m+1}{m}, \binom{m+2}{m}, \binom{m+3}{m}, \dots)$ | $\frac{1}{(1-z)^{m+1}}$ |
| $(1, c, \binom{c+1}{2}, \binom{c+2}{3}, \dots)$ | $\frac{1}{(1-z)^c}$ |
| $(1, c, c^2, c^3, \dots)$ | $\frac{1}{1-cz}$ |
| $(0, 1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots)$ | $\ln \frac{1}{1-z}$ |

A neat manipulation trick is:

$$\frac{1}{1-z}G(z) = \sum_n \sum_{k \leq n} g_k z^n$$

        }
        if (abs(y = 1/(y - (dbl)a)) > 3*N) return {NP, NQ};
        LP = P; P = NP; LQ = Q; Q = NQ;
    }
} // hash-1 = 67b717
```

frac-binary-search.h

Description: Given f and N , finds the smallest fraction $p/q \in [0, 1]$ such that $f(p/q)$ is true, and $p, q \leq N$. You may want to throw an exception from f if it finds an exact solution, in which case N can be removed.
Usage: `fracBS([])(Frac f) { return f.p>=3*f.q; }, 10); // {1,3}`
Time: $\mathcal{O}(\log(N))$

74ffd8, 20 lines

```
struct Frac { ll p, q; };
template<class F> Frac fracBS(F f, ll N) {
    bool dir = 1, A = 1, B = 1;
    Frac left{0, 1}, right{1, 1}; //right{1,0} to search (0,N]
    assert(!f(left)); assert(f(right));
    while (A || B) {
        ll adv = 0, step = 1; // move right if dir, else left
        for (int si = 0; step; (step *= 2) >= si) {
            adv += step;
            Frac mid{left.p * adv + right.p, left.q * adv + right.q};
            if (abs(mid.p) > N || mid.q > N || dir == !f(mid)) {
                adv -= step; si = 2;
            }
        }
        right.p += left.p * adv; right.q += left.q * adv;
        dir = !dir; swap(left, right);
        A = B; B = !adv;
    }
    return dir ? right : left;
}
```

5.5.1 Bézout’s identity

For $a \neq 0, b \neq 0$, then $d = \gcd(a, b)$ is the smallest positive integer for which there are integer solutions to

$$ax + by = d$$

If (x, y) is one solution, then all solutions are given by

$$\left(x + \frac{kb}{\gcd(a,b)}, y - \frac{ka}{\gcd(a,b)}\right), \quad k \in \mathbb{Z}$$

5.5.2 Pythagorean Triples

The Pythagorean triples are uniquely generated by

$$a = k \cdot (m^2 - n^2), \quad b = k \cdot (2mn), \quad c = k \cdot (m^2 + n^2),$$

with $m > n > 0, k > 0, m \perp n$, and either m or n even.

5.6 Primes

$p = 962592769$ is such that $2^{21} \mid p - 1$, which may be useful. For hashing use 970592641 (31-bit number), 31443539979727 (45-bit), 3006703054056749 (52-bit). There are 78498 primes less than 1 000 000.

Primitive roots exist modulo any prime power p^a , except for $p = 2, a > 2$, and there are $\phi(\phi(p^a))$ many. For $p = 2, a > 2$, the group $\mathbb{Z}_{2^a}^\times$ is instead isomorphic to $\mathbb{Z}_2 \times \mathbb{Z}_{2^{a-2}}$.

5.6.1 Prime counting function ($\pi(x)$)

The prime counting function is asymptotic to $\frac{x}{\log x}$, by the prime number theorem.

| | | | | | | | | |
|----------|----|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| x | 10 | 10 ² | 10 ³ | 10 ⁴ | 10 ⁵ | 10 ⁶ | 10 ⁷ | 10 ⁸ |
| $\pi(x)$ | 4 | 25 | 168 | 1.229 | 9.592 | 78.498 | 664.579 | 5.761.455 |

5.6.2 Sum of primes

For any multiplicative f :

$$S(n, p) = S(n, p - 1) - f(p) \cdot (S(n/p, p - 1) - S(p - 1, p - 1))$$

5.6.3 Moebius Function

$$\mu(n) = \begin{cases} 0 & n \text{ is not square free} \\ 1 & n \text{ has even number of prime factors} \\ -1 & n \text{ has odd number of prime factors} \end{cases}$$

Moebius Inversion:

$$g(n) = \sum_{d|n} f(d) \Leftrightarrow f(n) = \sum_{d|n} \mu(d) g(n/d)$$

Other useful formulas/forms:

$$\sum_{d|n} \phi(d) = n$$

$$\sum_{\substack{i < n \\ \gcd(i, n) = 1}} i = n \frac{\phi(n)}{2}$$

$$\sum_{a=1}^n \sum_{b=1}^n [\gcd(a, b) = 1] = \sum_{d=1}^n \mu(d) \lfloor \frac{n}{d} \rfloor^2$$

$$\sum_{a=1}^n \sum_{b=1}^n \gcd(a, b) = \sum_{d=1}^n d \sum_{d|x} \lfloor \frac{n}{x} \rfloor^2 \mu(\frac{x}{d})$$

$$\sum_{a=1}^n \sum_{b=a}^n \gcd(a, b) = \sum_{d=1}^n \sum_{d|x} \phi(\frac{x}{d}) d$$

$$\sum_{a=1}^n \sum_{b=1}^n \text{lcm}(a, b) = \sum_{d=1}^n \mu(d) d \sum_{d|x} x \left(\lfloor \frac{n}{x} \rfloor + 1\right)^2$$

$$\sum_{a=1}^n \sum_{b=a+1}^n \text{lcm}(a, b) = \sum_{d=1}^n \sum_{d|x} \phi(\frac{x}{d}) \frac{x^2}{2d}$$

$$\sum_{a \in S} \sum_{b \in S} \gcd(a, b) = \sum_{d=1}^n (\sum_{x|d} \frac{d}{x} \mu(x)) (\sum_{d|v} \text{freq}[v])^2$$

$$\sum_{a \in S} \sum_{b \in S} \text{lcm}(a, b) = \sum_{d=1}^n (\sum_{x|d} \frac{x}{d} \mu(x)) (\sum_{v \in S, d|v} v)^2$$

$$\sum_{d|n} \mu(d) = [n = 1] \text{ (very useful)}$$

$$g(n) = \sum_{n|d} f(d) \Leftrightarrow f(n) = \sum_{n|d} \mu(d/n) g(d)$$

$$g(n) = \sum_{1 \leq m \leq n} f(\lfloor \frac{n}{m} \rfloor) \Leftrightarrow f(n) = \sum_{1 \leq m \leq n} \mu(m) g(\lfloor \frac{n}{m} \rfloor)$$

5.6.4 Dirichlet Convolution

Given a function $f(x)$, let

$$(f * g)(x) = \sum_{d|x} g(d) f(x/d)$$

If the partial sums $s_{f*g}(n), s_g(n)$ can be computed in $O(1)$ and $s_f(1 \dots n^{2/3})$ can be computed in $O\left(n^{2/3}\right)$ then all $s_f\left(\frac{n}{d}\right)$ can as well. Use

$$s_{f*g}(n) = \sum_{d=1}^n g(d) s_f(n/d).$$

$$\Rightarrow s_f(n) = \frac{s_{f*g}(n) - \sum_{d=2}^n g(d) s_f(n/d)}{g(1)}$$

1. If $f(x) = \mu(x)$ then $g(x) = 1, (f * g)(x) = (x == 1)$, and $s_f(n) = 1 - \sum_{i=2}^n s_f(n/i)$
2. If $f(x) = \phi(x)$ then $g(x) = 1, (f * g)(x) = x$, and $s_f(n) = \frac{n(n+1)}{2} - \sum_{i=2}^n s_f(n/i)$

```

6.1.2 Binomials

- Sum of every element in the n -th row of pascal triangle is 2^n .
- The product of the elements in each row is $\frac{(n+1)^n}{n!}$
- $\sum_{k=0}^n \binom{n}{k}^2 = \binom{2n}{n}$
- In a row p where p is a prime number, all the terms in that row except the 1s are multiples of p
- To count odd terms in row n , convert n to binary. Let x be the number of 1s in the binary representation. Then the number of odd terms will be 2^x
- Every entry in row $2^n - 1$ is odd

$$\begin{aligned} \binom{n}{k} &= \frac{n}{k} \binom{n-1}{k-1} & (x+y)^n &= \sum_{k=0}^n \binom{n}{k} x^{n-k} y^k \\ \sum_{k=0}^n \binom{n}{k} k &= n2^{n-1} & \sum_{j=0}^n \binom{m}{j} \binom{n-m}{n-j} &= \binom{n}{m} \\ \sum_{m=0}^n \binom{m}{j} \binom{n-m}{n-j} &= \binom{n+1}{k+1} & \sum_{r=0}^n m \binom{n+r}{r} &= \binom{n+m+1}{m} \\ \binom{n}{k} \binom{n-k}{v} &= \binom{n}{v} \binom{n-v}{k} & \sum_{m=k}^n \binom{m}{k} &= \binom{n+1}{k+1} \\ \sum_{j=0}^m \binom{m}{j}^2 &= \binom{2m}{m} & 2 \sum_{i=L}^R \binom{n}{i} - \binom{n}{L} - \binom{n}{R} &= \sum_{i=L+1}^R \binom{n+1}{i} \end{aligned}$$

lucas.h

Description: Lucas' thm: Let n, m be non-negative integers and p a prime. Write $n = n_k p^k + \dots + n_1 p + n_0$ and $m = m_k p^k + \dots + m_1 p + m_0$. Then $\binom{n}{m} \equiv \prod_{i=0}^k \binom{n_i}{m_i} \pmod{p}$. fact and ifact must hold pre-computed factorials / inverse factorials, e.g. from ModInv.h.
Time: $\mathcal{O}(\log_p m)$

rolling-binomial.h

Description: $\binom{n}{k} \pmod{m}$ in time proportional to the difference between (n, k) and the previous (n, k) .

```
de359e, 12 lines
"../number-theory/preparator.h"
struct Bin {
    int N = 0, K = 0; ll r = 1;
    void m(int a, int b) { r = r * a % mod * invs[b] % mod; }
    ll choose(int n, int k) {
        if (k > n || k < 0) return 0;
        while (N < n) ++N, m(N, N - K);
        while (K < k) ++K, m(N - K + 1, K);
        while (K > k) m(K, N - K + 1), --K;
        while (N > n) m(N - K, N), --N;
        return r;
    }
};
```

multinomial.h

Description: Computes $\binom{k_1 + \dots + k_n}{k_1, k_2, \dots, k_n} = \frac{(\sum k_i)!}{k_1! k_2! \dots k_n!}$.

int-perm lucas rolling-binomial multinomial partitions

```
lint multinomial(vector<int>& v) {
    lint c = 1, m = v.empty() ? 1 : v[0];
    for (int i = 1 < v.size(); ++i)
        for (int j = 0; j < v[i]; ++j)
            c = c * ++m / (j+1);
    return c;
}
```

6.1.3 The twelvefold way (from Stanley)

How many functions $f: N \rightarrow X$ are there?

| N | X | Any f | Injective | Surjective |
|---------|---------|---|---------------------|--|
| dist. | dist. | x^n | $\frac{x!}{(x-n)!}$ | $x! \left\{ \begin{smallmatrix} n \\ x \end{smallmatrix} \right\}$ |
| indist. | dist. | $\binom{x+n-1}{n}$ | $\binom{x}{n}$ | $\binom{n-1}{n-x}$ |
| dist. | indist. | $\left\{ \begin{smallmatrix} n \\ 1 \end{smallmatrix} \right\} + \dots + \left\{ \begin{smallmatrix} n \\ x \end{smallmatrix} \right\}$ | $[n \leq x]$ | $\left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\}$ |
| indist. | indist. | $p_1(n) + \dots p_x(n)$ | $[n \leq x]$ | $p_x(n)$ |

Where $\binom{a}{b} = \frac{1}{b!} (a)_b$, $p_x(n)$ is the number of ways to partition the integer n using x summand and $\left\{ \begin{smallmatrix} n \\ x \end{smallmatrix} \right\}$ is the number of ways to partition a set of n elements into x subsets (aka Stirling number of the second kind).

6.1.4 Burnside

Given a group G of symmetries and a set X , the number of elements of X up to symmetry equals

$$\frac{1}{|G|} \sum_{g \in G} |X^g|,$$

where X^g are the elements fixed by g ($g.x = x$).

If $f(n)$ counts “configurations” (of some sort) of length n , we can ignore rotational symmetry using $G = \mathbb{Z}_n$ to get

$$g(n) = \frac{1}{n} \sum_{k=0}^{n-1} f(\gcd(n, k)) = \frac{1}{n} \sum_{k|n} f(k) \phi(n/k)$$

6.1.5 Cycles

Let the number of n -permutations whose cycle lenghts all belong to the set S be denoted by $g_S(n)$

$$\sum_{n=0}^{\infty} g_S(n) \frac{x^n}{n!} = \exp \left(\sum_{n \in S} \frac{x^n}{n} \right)$$

6.1.6 Involutions

An involution is a permutation with maximum cycle length 2, and it is its own inverse.

$$a(n) = a(n-1) + (n-1)a(n-2), a(0) = a(1) = 1.$$

1, 1, 2, 4, 10, 26, 76, 232, 764, 2620, 9496, 35696, 140152

6.1.7 Derangements

Permutations of a set such that none of the elements appear in their original position.

$$D(n) = (n-1)(D(n-1) + D(n-2)) = nD(n-1) + (-1)^n = \left\lfloor \frac{n!}{e} \right\rfloor$$

6.2 Partitions and subsets

6.2.1 Partition function

Number of ways of writing n as a sum of positive integers, disregarding the order of the summands.

$$p(0) = 1, p(n) = \sum_{k \in \mathbb{Z} \setminus \{0\}} (-1)^{k+1} p(n - k(3k-1)/2)$$

$$p(n) \sim 0.145/n \cdot \exp(2.56\sqrt{n})$$

| | | | | | | | | | | | | | |
|--------|---|---|---|---|---|---|----|----|----|----|-----|------------|------------|
| n | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 20 | 50 | 100 |
| $p(n)$ | 1 | 1 | 2 | 3 | 5 | 7 | 11 | 15 | 22 | 30 | 627 | $\sim 2e5$ | $\sim 2e8$ |

partitions.h

```
3af1e7, 14 lines
vector<int64_t> prep(int N) {
    vector<int64_t> dp(N); dp[0] = 1;
    for (int n = 1; n < N; ++n) {
        int64_t sum = 0;
        for (int k = 0, l = 1, m = n - 1; ;) {
            sum += dp[m]; if ((m -= (k += 1)) < 0) break;
            sum += dp[m]; if ((m -= (l += 2)) < 0) break;
            sum -= dp[m]; if ((m -= (k += 1)) < 0) break;
            sum -= dp[m]; if ((m -= (l += 2)) < 0) break;
        }
        if ((sum %= M) < 0) sum += M;
        dp[n] = sum;
    } return dp;
}
```

6.3 General purpose numbers

6.3.1 Bernoulli numbers

EGF of Bernoulli numbers is $B(t) = \frac{t}{e^t - 1}$ (FFT-able).
 $B[0, \dots] = [1, -\frac{1}{2}, \frac{1}{6}, 0, -\frac{1}{30}, 0, \frac{1}{42}, \dots]$

Sums of powers:

$$\sum_{i=1}^n n^m = \frac{1}{m+1} \sum_{k=0}^m \binom{m+1}{k} B_k (n+1)^{m+1-k}$$

Euler-Maclaurin formula for infinite sums:

$$\begin{aligned} \sum_{i=m}^{\infty} f(i) &= \int_m^{\infty} f(x) dx - \sum_{k=1}^{\infty} \frac{B_k}{k!} f^{(k-1)}(m) \\ &\approx \int_m^{\infty} f(x) dx + \frac{f(m)}{2} - \frac{f'(m)}{12} + \frac{f'''(m)}{720} + O(f^{(5)}(m)) \end{aligned}$$

6.3.2 Stirling numbers of the first kind

Number of permutations on n items with k cycles.

$$c(n, k) = c(n-1, k-1) + (n-1)c(n-1, k), c(0, 0) = 1$$

$$\sum_{k=0}^n c(n, k) x^k = x(x+1) \dots (x+n-1)$$

$$c(8, k) = 8, 0, 5040, 13068, 13132, 6769, 1960, 322, 28, 1$$

$$c(n, 2) = 0, 0, 1, 3, 11, 50, 274, 1764, 13068, 109584, \dots$$

6.3.3 Eulerian numbers

Number of permutations $\pi \in S_n$ in which exactly k elements are greater than the previous element. k j:s s.t. $\pi(j) > \pi(j+1)$, $k+1$ j:s s.t. $\pi(j) \geq j$, k j:s s.t. $\pi(j) > j$.

$$E(n, k) = (n-k)E(n-1, k-1) + (k+1)E(n-1, k)$$

$$E(n, 0) = E(n, n-1) = 1$$

$$E(n, k) = \sum_{j=0}^k (-1)^j \binom{n+1}{j} (k+1-j)^n$$

6.3.4 Stirling numbers of the second kind

Partitions of n distinct elements into exactly k groups.

$$S(n,k)=S(n-1,k-1)+kS(n-1,k)$$

$$S(n,1)=S(n,n)=1$$

$$S(n,k)=\frac{1}{k!}\sum_{j=0}^k(-1)^{k-j}\binom{k}{j}j^n$$

6.3.5 Bell numbers

Total number of partitions of n distinct elements. $B(n)=1,1,2,5,15,52,203,877,4140,21147,\dots$

$$\mathcal{B}_{n+1}=\sum_{k=0}^n\binom{n}{k}\mathcal{B}_k$$

Also possible to calculate using Stirling numbers of the second kind,

$$B_n=\sum_{k=0}^nS(n,k)$$

If p is prime:

$$B(p^m+n)\equiv mB(n)+B(n+1)\pmod{p}$$

6.3.6 Labeled unrooted trees

on n vertices: n^{n-2}
on k existing trees of size n_i : $n_1n_2\cdots n_kn^{k-2}$
with degrees d_i : $(n-2)!/((d_1-1)!\cdots(d_n-1)!)$ # forests with exactly k rooted trees:

$$\binom{n}{k}\cdot n^{n-k-1}$$

.

6.3.7 Catalan numbers

$$C_n=\frac{1}{n+1}\binom{2n}{n}=\binom{2n}{n}-\binom{2n}{n+1}=\frac{(2n)!}{(n+1)n!}$$

$$C_0=1,\;C_{n+1}=\frac{2(2n+1)}{n+2}C_n,\;C_{n+1}=\sum C_iC_{n-i}$$

$$C_n=1,1,2,5,14,42,132,429,1430,4862,16796,58786,\dots$$

- sub-diagonal monotone paths in a $n\times n$ grid.
- strings with n pairs of parenthesis, correctly nested.
- binary trees with with $n+1$ leaves (0 or 2 children) or $2n+1$ elements.
- ordered trees with $n+1$ vertices.
- # ways a convex polygon with $n+2$ sides can be cut into triangles by connecting vertices with straight lines.
- permutations of $[n]$ with no 3-term increasing subsequence.

nim-product

6.3.8 Super Catalan numbers

The number of monotonic lattice paths of a $n\times n$ grid that do not touch the diagonal.

$$S(n)=\frac{3(2n-3)S(n-1)-(n-3)S(n-2)}{n}$$

$$S(1)=S(2)=1$$

$$1,1,3,11,45,197,903,4279,20793,103049,518859$$

6.3.9 Motzkin numbers

Number of ways of drawing any number of nonintersecting chords among n points on a circle. Number of lattice paths from $(0,0)$ to $(n,0)$ never going below the x -axis, using only steps NE, E, SE.

$$M(n)=\frac{3(n-1)M(n-2)+(2n+1)M(n-1)}{n+2}$$

$$M(0)=M(1)=1$$

$$1,1,2,4,9,21,51,127,323,835,2188,5798,15511,41835,113634$$

6.3.10 Narayana numbers

Number of lattice paths from $(0,0)$ to $(2n,0)$ never going below the x -axis, using only steps NE and SE, and with k peaks.

$$N(n,k)=\frac{1}{n}\binom{n}{k}\binom{n}{k-1}$$

$$N(n,1)=N(n,n)=1$$

$$\sum_{k=1}^nN(n,k)=C_n$$

$$1,1,1,1,3,1,1,6,6,1,1,10,20,10,1,1,15,50$$

6.3.11 Schroder numbers

Number of lattice paths from $(0,0)$ to (n,n) using only steps N,NE,E, never going above the diagonal. Number of lattice paths from $(0,0)$ to $(2n,0)$ using only steps NE, SE and double east EE, never going below the x -axis. Twice the Super Catalan number, except for the first term.

$$1,2,6,22,90,394,1806,8558,41586,206098$$

6.3.12 Triangles

Given rods of length 1, ..., n ,

$$T(n)=\frac{1}{24}\left\{\begin{array}{cc}n(n-2)(2n-5)&n\text{ even} \\(n-1)(n-3)(2n-1)&n\text{ odd}\end{array}\right\}$$

is the number of distinct triangles (positive are) that can be constructed, i.e., the # of 3-subsets of $[n]$ s.t. $x\leq y\leq z$ and $z\neq x+y$.

6.4 Fibonacci

$$Fib(x+y)=Fib(x+1)Fib(y)+Fib(x)Fib(y-1)$$

$$Fib(n+1)Fib(n-1)-Fib(n)^2=(-1)^n$$

$$Fib(2n-1)=Fib(n)^2-Fib(n-1)^2$$

$$\sum_{i=0}^nFib(i)=Fib(n+2)-1$$

$$\sum_{i=0}^nFib(i)^2=Fib(n)Fib(n+1)$$

$$\sum_{i=0}^nFib(i)^3=\frac{Fib(n)Fib(n+1)^2-(-1)^nFib(n-1)+1}{2}$$

6.5 Linear Recurrences

$$F_i=\sum_{j=1}^KC_jF_{i-j}+D$$
$$\begin{bmatrix}0&1&0&0&\vdots&0&0\\0&0&1&0&\vdots&0&0\\0&0&0&1&\vdots&0&0\\C_K&C_{K-1}&C_{K-2}&C_{K-3}&\vdots&C_1&1\\0&0&0&0&\vdots&0&1\end{bmatrix}\begin{bmatrix}F_0\\F_1\\F_2\\F_3\\F_{K-1}\\D\end{bmatrix}=\begin{bmatrix}F_1\\F_2\\F_3\\F_K\\F_D\end{bmatrix}$$

6.6 Game Theory

A game can be reduced to Nim if it is a finite impartial game. Nim and its variants include:

6.6.1 Nim

Let $X=\bigoplus_{i=1}^nx_i$, then $(x_i)_{i=1}^n$ is a winning position iff $X\neq 0$. Find a move by picking k such that $x_k>x_k\oplus X$.

6.6.2 Misère Nim

Regular Nim, except that the last player to move *loses*. Play regular Nim until there is only one pile of size larger than 1, reduce it to 0 or 1 such that there is an odd number of piles. The second player wins (a_1,\dots,a_n) if 1) there is a pile $a_i>1$ and $\bigoplus_{i=1}^na_i=0$ or 2) all $a_i\leq 1$ and $\bigoplus_{i=1}^na_i=1$.

6.6.3 Staircase Nim

Stones are moved down a staircase and only removed from the last pile. $(x_i)_{i=1}^n$ is an L -position if $(x_{2i-1})_{i=1}^{n/2}$ is (i.e. only look at odd-numbered piles).

nim-product.cpp

Description: Product of nimburs is associative, commutative, and distributive over addition (xor). Forms finite field of size 2^{2^k} . Application: Given 1D coin turning games G_1,G_2 $G_1\times G_2$ is the 2D coin turning game defined as follows. If turning coins at x_1,x_2,\dots,x_m is legal in G_1 and y_1,y_2,\dots,y_n is legal in G_2 , then turning coins at all positions (x_i,y_j) is legal assuming that the coin at (x_m,y_n) goes from heads to tails. Then the grundy function $g(x,y)$ of $G_1\times G_2$ is $g_1(x)\times g_2(y)$.

Time: 64^2 xors per multiplication, memorize to speed up.

bcc.h

Description: Finds all biconnected components in an undirected graph. In a biconnected component there are at least two distinct paths between any two nodes or the component is a bridge. Note that a node can be in several components. *blockcut* constructs the block cut tree of given graph. The first nodes represents the blocks, the others represents the articulation points.

Usage: int e_id = 0; vector<pair<int, int>> g(N);

for (auto [a,b] : edges) {
g[a].emplace_back(b, e_id);
g[b].emplace_back(a, e_id++); }
bcc_t b(g); b.solve([&](const vector<int>& edges_id) {...});
Time: $\mathcal{O}(E + V)$

```

2sat.h

Description: Calculates a valid assignment to boolean variables a, b, c, \dots to a 2-SAT problem, so that an expression of the type $(a||b) \&\& (!a||c) \&\& (d||!b) \&\& \dots$ becomes true, or reports that it is unsatisfiable. Negated variables are represented by bit-inversions ($\sim x$).

Usage: TwoSat ts(number of boolean variables);

ts.either(0, ~ 3); // Var 0 is true or var 3 is false

ts.set_value(2); // Var 2 is true

ts.at_most_one({0, ~ 1 , 2}); // ≤ 1 of vars 0, ~ 1 and 2 are true

ts.solve(); // Returns true iff it is solvable

ts.values[0..N-1] holds the assigned values to the vars

Time: $O(N + E)$, where N is the number of boolean variables, and E is the number of clauses.

};
```

7.5 Matching

hopcroft-karp.h

Description: Fast bipartite matching algorithm. Graph g should be a list of neighbors of the left partition, and btoa should be a vector full of -1's of the same size as the right partition. Returns the size of the matching. $\text{btoa}[i]$ will be the match for vertex i on the right side, or -1 if it's not matched.

Usage: vector<int> btoa(m, -1); hopcroftKarp(g, btoa);

Time: $O(\sqrt{VE})$

d9a55d, 35 lines

```
using vi = vector<int>;

7.8 Theorems

7.8.1 Euler's theorem

Let V , A and F be the number of vertices, edges and faces of connected planar graph, $V - A + F = 2$.

7.8.2 Eulerian Cycles

The number of Eulerian cycles in a *directed* graph G is:

$t_w(G) \prod_{v \in G} (\deg v - 1)!$, where $t_w(G)$ is the number of arborescences (“directed spanning” tree) rooted at w (Check Number of Spanning Trees)

7.8.3 Konig's theorem

In any bipartite graph the following holds: Maximum matching and minimum vertex cover have the same cardinality. Minimum edge cover, minimum path cover and maximum independent set have the same cardinality $N - |M|$.

7.8.4 Construct minimum vertex cover from maximum matching on bipartite graph

1. Redirect every edge: $y \rightarrow x$ if $(x, y) \in M$, $x \rightarrow y$ otherwise.

2. DFS from unmatched vertices in X .
3. $x \in X$ is chosen iff x is unvisited.
4. $y \in Y$ is chosen iff y is visited.

7.8.5 Minimum weight edge cover

1. For each $v \in V$ create a copy v' , and connect $u' \rightarrow v'$ with weight $w(u, v)$.
2. Connect $v \rightarrow v'$ with weight $2\mu(v)$, where $\mu(v)$ is the cost of the cheapest edge incident to v .
3. Find the minimum weight perfect matching on G' .

7.8.6 Maximum/Minimum flow with lower bound / Circulation problem

1. Construct super source S and sink T .
2. For each edge (x, y, l, u) , connect $x \rightarrow y$ with capacity $u - l$.
3. For each vertex v , denote by $in(v)$ the difference between the sum of incoming lower bounds and the sum of outgoing lower bounds.
4. If $in(v) > 0$, connect $S \rightarrow v$ with capacity $in(v)$, otherwise, connect $v \rightarrow T$ with capacity $-in(v)$.

- To maximize, connect $t \rightarrow s$ with capacity ∞ (skip this in circulation problem), and let f be the maximum flow from S to T . If $f \neq \sum_{v \in V, in(v) > 0} in(v)$, there's no solution. Otherwise, the maximum flow from s to t is the answer.
 - To minimize, let f be the maximum flow from S to T . Connect $t \rightarrow s$ with capacity ∞ and let the flow from S to T be f' . If $f + f' \neq \sum_{v \in V, in(v) > 0} in(v)$, there's no solution. Otherwise, f' is the answer.
5. The solution of each edge e is $l_e + f_e$, where f_e corresponds to the flow of edge e on the graph.

7.8.7 Minimum cost cyclic flow

1. Construct super source S and sink T
2. For each edge (x, y, c) , connect $x \rightarrow y$ with $(cost, cap) = (c, 1)$ if $c > 0$, otherwise connect $y \rightarrow x$ with $(cost, cap) = (-c, 1)$
3. For each edge with $c < 0$, sum these cost as K , then increase $d(y)$ by 1, decrease $d(x)$ by 1
4. For each vertex v with $d(v) > 0$, connect $S \rightarrow v$ with $(cost, cap) = (0, d(v))$
5. For each vertex v with $d(v) < 0$, connect $v \rightarrow T$ with $(cost, cap) = (0, -d(v))$
6. Flow from S to T , the answer is the cost of the flow $C + K$

7.8.8 Maximum density induced subgraph

1. Binary search on answer, suppose we're checking answer T
2. Construct a max flow model, let K be the sum of all weights
3. Connect source $s \rightarrow v$, $v \in G$ with capacity K
4. For each edge (u, v, w) in G , connect $u \rightarrow v$ and $v \rightarrow u$ with capacity w
5. For $v \in G$, connect it with sink $v \rightarrow t$ with capacity $K + 2T - (\sum_{e \in E(v)} w(e)) - 2w(v)$
6. T is a valid answer if the maximum flow $f < K|V|$

7.8.9 Project selection problem

1. If $p_v > 0$, create edge (s, v) with capacity p_v ; otherwise, create edge (v, t) with capacity $-p_v$.
2. Create edge (u, v) with capacity w with w being the cost of choosing u without choosing v .
3. The mincut is equivalent to the maximum profit of a subset of projects.

7.8.10 0/1 quadratic programming

$$\sum_x c_x x + \sum_y c_y \bar{y} + \sum_{xy} c_{xy} x \bar{y} + \sum_{xyx'y'} c_{xyx'y'} (x \bar{y} + x' \bar{y}')$$

can be minimized by the mincut of the following graph:

1. Create edge (x, t) with capacity c_x and create edge (s, y) with capacity c_y .
2. Create edge (x, y) with capacity c_{xy} .
3. Create edge (x, y) and edge (x', y') with capacity $c_{xyx'y'}$.

7.8.11 Number of Spanning Trees

Define Laplacian Matrix as $L = D - A$, D being a Diagonal Matrix with $D_{i,i} = \deg(i)$ and A an Adjacency Matrix. Create an $N \times N$ Laplacian matrix mat , and for each edge $a \rightarrow b \in G$, do $\text{mat}[a][b]--$, $\text{mat}[b][b]++$ (and $\text{mat}[b][a]--$, $\text{mat}[a][a]++$ if G is undirected). Remove the i th row and column and take the determinant; this yields the number of directed spanning trees rooted at i (if G is undirected, remove any row/column).

7.8.12 Tutte Matrix

- A graph has a perfect matching iff the *Tutte* matrix has a non-zero determinant.
- The rank of the *Tutte* matrix is equal to twice the size of the maximum matching. The maximum cost matching can be found by polynomial interpolation.

            }
        }
    }
};
```

9.1 Suffix Automaton

9.1.1 Number of different substrings

Is the number of paths in the automaton starting at the root.

$$d(v) = 1 + \sum_{v \rightarrow w} d(w)$$

9.1.2 Total length of different substrings

Is the sum of children answers and paths starting at each

$$\text{children. } ans(v) = \sum_{v \rightarrow w} d(w) + ans(w)$$

9.1.3 Lexicographically K -th substring

Is the K -th lexicographically path, so you can search using the number of paths from each state

9.1.4 Smallest cyclic shift

Construct for string $S + S$. Greedily search the minimal character.

9.1.5 Number of occurrences

For each state not created by cloning, initialize $cnt(v) = 1$. Then, just do a dfs to calculate $cnt(v)$, with $cnt(link(v)) + cnt(v)$

9.1.6 First occurence position

When we create a new state cur do $first(pos) = len(cur) - 1$. When we clone q as $clone$ do $first(clone) = first(q)$. Answer is $first(v) - size(P) + 1$, where v is the state of string P

9.1.7 All occurence positions

From $first(v)$ do a dfs using suffix link, from $link(u)$ go to u .

Various (10)

10.1 Intervals

interval-container.h

Description: Add and remove intervals from a set of disjoint intervals. Will merge the added interval with any overlapping intervals in the set when adding. Intervals are [inclusive, exclusive).

Time: $\mathcal{O}(\log N)$

```
set<pii>::iterator addInterval(set<pii> &is, int L, int R) {
    if (L == R) return is.end();
    auto it = is.lower_bound({L, R}), before = it;
    while (it != is.end() && it->first <= R) {
        R = max(R, it->second);
        before = it = is.erase(it);
    }
    if (it != is.begin() && (--it)->second >= L) {
        L = min(L, it->first); R = max(R, it->second);
        is.erase(it);
    }
    return is.insert(before, {L, R});
}
void removeInterval(set<pii> &is, int L, int R) {
    if (L == R) return;
    auto it = addInterval(is, L, R);
    auto r2 = it->second;
    if (it->first == L) is.erase(it);
    else (int&)it->second = L;
    if (R != r2) is.emplace(R, r2);
}
```

interval-cover.h

Description: Compute indices of smallest set of intervals covering another interval. Intervals should be [inclusive, exclusive). To support [inclusive, inclusive], change (A) to add || R.empty(). Returns empty set on failure (or if G is empty).

Time: $\mathcal{O}(N \log N)$

```
template<class T>
vector<int> cover(pair<T, T> G, vector<pair<T, T>> I) {
    vector<int> S(I.size(), R);
    iota(S.begin(), S.end(), 0);
    sort(S.begin(), S.end(), [&](int a, int b) {
        return I[a] < I[b]; });
    T cur = G.first; int at = 0;
    while (cur < G.second) { // (A)
        pair<T, int> mx = {cur, -1};
        while (at < I.size() && I[S[at]].first <= cur) {
            mx = max(mx, {I[S[at]].second, S[at]});
            at++;
        }
        if (mx.second == -1) return {};
        cur = mx.first; R.push_back(mx.second);
    }
    return R;
}
```

constant-intervals.h

Description: Split a monotone function on [from, to) into a minimal set of half-open intervals on which it has the same value. Runs a callback g for each such interval.

Usage: constantIntervals(0, sz(v), [&](int x){ return v[x]; }, [&](int lo, int hi, T val){...});

Time: $\mathcal{O}(k \log \frac{n}{k})$

```
template<class F, class G, class T>
void rec(int from, int to, F& f, G& g, int& i, T& p, T q) {
    if (p == q) return;
    if (from == to) {
        g(i, to, p); i = to; p = q;
    }
```

```
} else {
    int mid = (from + to) >> 1;
    rec(from, mid, f, g, i, p, f(mid));
    rec(mid+1, to, f, g, i, p, q);
}
}
template<class F, class G>
void constantIntervals(int from, int to, F f, G g) {
    if (to <= from) return;
    int i = from; auto p = f(i), q = f(to-1);
    rec(from, to-1, f, g, i, p, q); g(i, to, q);
}
```

10.2 Misc. algorithms

ternary-search.h

Description: Find the smallest i in $[a, b]$ that maximizes $f(i)$, assuming that $f(a) < \dots < f(i) \geq \dots \geq f(b)$. To reverse which of the sides allows non-strict inequalities, change the $<$ marked with (A) to $<=$, and reverse the loop at (B). To minimize f , change it to $>$, also at (B). If you are dealing with real numbers, you'll need to pick $m_1 = (2a + b)/3.0$ and $m_2 = (a + 2b)/3.0$. Consider setting a constant number of iterations for the search, usually [200, 300] iterations are sufficient for problems with error limit as 10^{-6} .

Usage: int ind = ternSearch(0,n-1,[&](int i){return a[i];});

Time: $\mathcal{O}(\log(b - a))$

```
template<class F> int ternSearch(int a, int b, F f) {
    assert(a <= b);
    while (b - a >= 5) {
        int mid = (a + b) / 2;
        if (f(mid) < f(mid+1)) a = mid; // (A)
        else b = mid+1;
    }
    for(int i = a+1; i <= b; ++i)
        if (f(a) < f(i)) a = i; // (B)
    return a;
}
```

count-triangles.h

Description: Counts $x, y \geq 0$ such that $Ax + By \leq C$.

Time: $\mathcal{O}(C)$

```
ll count_triangle(ll A, ll B, ll C) {
    if (C < 0) return 0;
    if (A > B) swap(A, B);
    ll p = C / B, k = B / A, d = (C - p * B) / A;
    return count_triangle(B - k * A, A, C - A * (k * p + d + 1))
        + (p + 1) * (d + 1) + k * p * (p + 1) / 2;
}
```

floyd-cycle.h

Description: Detect loop in a list. Consider using mod template to avoid overflow.

Time: $\mathcal{O}(n)$

```
template<class F> pair<int,int> find(int x0, F f) {
    int t = f(x0), h = f(t), mu = 0, lam = 1;
    while (t != h) t = f(t), h = f(f(h));
    h = x0;
    while (t != h) t = f(t), h = f(h), ++mu;
    h = f(t);
    while (t != h) h = f(h), ++lam;
    return {mu, lam};
}
```

10.3 Dynamic programming

divide-and-conquer-dp.h

Description: Given $a[i] = \min_{lo(i) \leq k < hi(i)} (f(i, k))$ where the (minimal) optimal k increases with i , computes $a[i]$ for $i = L..R - 1$.

Time: $\mathcal{O}((N + (hi - lo)) \log N)$

c7f2d1, 29 lines

```

    }
    ll f(int ind, int k) { return old[k] + C(k, ind); }
    void store(int ind, int k, ll v) { cur[ind] = v; }
    void rec(int L, int R, int LO, int HI) {
        if (L >= R) return;
        int mid = (L + R) >> 1;
        pair<ll, int> best(LLONG_MAX, LO);
        for(int k = max(LO,lo(mid)); k <= min(HI,hi(mid)); ++k)
            best = min(best, make_pair(f(mid, k), k));
        store(mid, best.second, best.first);
        rec(L, mid, LO, best.second);
        rec(mid+1, R, best.second, HI);
    }
};
```

knuth-dp.h
Description: When doing DP on intervals: $a[i][j] = \min_{i < k < j} (a[i][k] + a[k][j]) + f(i, j)$, where the (minimal) optimal k increases with both i and j , one can solve intervals in increasing order of length, and search $k = p[i][j]$ for $a[i][j]$ only between $p[i][j - 1]$ and $p[i + 1][j]$. This is known as Knuth DP. Sufficient criteria for this are if $f(b, c) \leq f(a, d)$ and $f(a, c) + f(b, d) \leq f(a, d) + f(b, c)$ for all $a \leq b \leq c \leq d$. Consider also: LineContainer (ch. Data structures), monotone queues, ternary search.
Time: $\mathcal{O}(N^2)$

digit-dp.h
Description: Compute how many # between 1 and N have K distinct digits in the base L without leading zeros;
Usage: auto hex.to.dec = [&](char c) -> int { return ('A' <= c && c <= 'F' ? (10 + c - 'A') : (c - '0'))};
digit_dp<modnum<int(1e9) + 7>, hex.to.dec>(N, K);
Time: $\mathcal{O}(NK)$

```
template<typename T, class F> T digit_dp(const string& S, int K
    , F& L) {
    const int base = 16, len = int(S.size());
    vector<bool> w(base);
    vector<vector<T>> dp(len + 1, vector<T>(base + 2));
    int cnt = 0;
    for (int d = 0; d < len; ++d) {
        // adding new digit to numbers with prefix < s
        for (int x = 0; x <= base; ++x) {
            dp[d + 1][x] += dp[d][x] * x;
            dp[d + 1][x + 1] += dp[d][x] * (base - x);
        }
        // adding strings whith prefix only 0's and last digit != 0
        if (d) dp[d + 1][1] += (base - 1);
        // adding prefix equal to s and last digit < s, first digit
            cannot be 0
        for (int x = 0; x < L(S[d]); ++x) {
```

```
            if (d == 0 && x == 0) continue;
            if (w[x]) dp[d + 1][cnt] += 1;
            else dp[d + 1][cnt + 1] += 1;
        }
        // marking if the last digit appears in the prefix of s
        if (w[L(S[d])]) == false)
            w[L(S[d])] = true, cnt++;
    }
    // adding string k
    dp[len][cnt] += 1; return dp[len][K];
}
```

knapsack-bounded.h
Description: You are given n types of items, each items has a weight and a quantity. Is possible to fill a knapsack with capacity X using any subset of items?
Time: $\mathcal{O}(W \cdot N)$

```
auto solve(vi weight, vi cnt, int X) {
    vector<int> dp(X+1, 0);
    for (int i = 0; i < N; ++i)
        for (int j = X-weight[i]; j >= 0; --j) {
            if (!dp[j]) continue;
            int k = cnt[i], s = j + weight[i];
            while (k > 0 && s <= X && !dp[s])
                dp[s] = 1, --k, s += weight[i];
        }
    return dp[X];
}
```

knapsack-bounded-costs.h
Description: You are given N types of items, you have $cnt[i]$ items of i -th type, and each item of i -th type $weight[i]$ and $cost[i]$. What is the maximal cost you can get by picking some items weighing exactly X in total?
Time: $\mathcal{O}(N \cdot W)$

```
"../data-structures/monotonic-queue.h"
